Hiring Team, Iterable

Your posting wants someone who builds the Deal Desk while running it, not one or the other. I have done both: I set up PriceKeel's CRM, CPQ and deal-approval process from scratch, and I now run every non-standard exception through it myself before it reaches a customer.

The deal-economics half is the part I can show you a number for. At Sensata I built the Bleeders and Leakers dashboard, modeling margin, discount trend and deal structure across 1,200 opportunities against a $627M target, then closed $700K+ of it in two quarters by evaluating each non-standard term against willingness to pay and recommending the structure that worked for both sides. I raised distributor margins from 53% to 61% the same way, by fixing the pricing logic itself rather than issuing one-time overrides, and I shaped AP26 revenue models and multimillion-dollar customer quotes directly with senior executives.

Cross-functional coordination is the other half of the role, and it is not new to me either. I partner with Sales, Engineering and Accounts at Applied Materials to turn competing field input into one forecasting view, and I ran sales enablement for 50+ reps at Sensata that lifted win rates 30% by fixing what they needed at each deal stage. I am comfortable in Salesforce's account-opportunity-contract model because I built that connective tissue myself, not because I read about it.

I would welcome the chance to talk through how I would spend my first quarter inside Iterable's Deal Desk: clearing the queue, then finding the one process bottleneck worth automating next. Proof trail at adhi-pricing-ai.vercel.app/ref/iterable.
