Hiring Team, Level AI

Your posting is blunt about the test: if you have only maintained a machine someone else built, this isn't the fit. I built the machine myself. I founded PriceKeel and designed its guardrail engine, CRM, CPQ, forecast and pipeline reviews, and deal-approval process from a blank canvas, with no existing infrastructure to inherit.

The CRO's operating system half is where I have a concrete number. At Sensata I built the Bleeders and Leakers Power BI dashboard, a self-serve executive view of 1,200 opportunities against a $627M target with win rate, average deal size and stage distribution by salesperson, then closed $700K+ of what it surfaced in two quarters. I raised distributor margins from 53% to 61% by fixing the pricing logic itself, the deal-desk discipline your posting calls "pricing guardrails… built to move fast without leaking margin."

GTM AI agents are not a novelty for me either. At Applied Materials I architect and ship AI agents built on Claude that cut manual work out of recurring forecasting, the same "AI in the loop" building this role treats as core stack. What I can show you across PriceKeel, Sensata and Applied Materials is that I have built this exact category of system, forecast engine, deal desk, dashboard, more than once, from zero.

I would welcome the chance to talk through how I would approach the forecast engine's first sprint. Proof trail at adhi-growth-ai.vercel.app/ref/level-ai.
