Hiring Team, MongoDB

Your posting wants someone who turns ideas into measurable programs and finds growth opportunities through product, market and customer analysis. At Sensata I built the KPI frameworks in SQL and GA4 that found the high-intent cohorts and adoption signals behind an 18% feature-adoption lift across 50,000+ connected devices, the same data-driven growth-opportunity work this role runs on daily.

Retention is where I can show you a number instead of a plan. At Pixis I carried churn targets across an 8-client, $15K to $90K-per-client portfolio and cut churn 50% through proactive account strategy and vertical playbooks, not a single campaign. I also shipped a full activation program at SwipeHire: 8+ A/B tests and 12+ user interviews lifted activation 25%, which is the closest I can point to for turning an onboarding hypothesis into a measured result.

The experimentation half is a habit across every seat I have held. I ran 15+ A/B tests at Plug Power that cut CPA 25%, and automated the lead flow and Mar-Tech stack so the funnel report stayed trustworthy between cycles. I write for both marketers and a technical audience comfortably, having translated engineering features into customer value propositions for sensor products at Sensata.

I would welcome the chance to talk through how I would approach the first lifecycle experiment on Atlas. Proof trail at adhi-growth-ai.vercel.app/ref/mongodb.
