Hiring Team, Enterpret

Your posting describes a job I already do for myself: find a broken revenue workflow, fix it, and prove the fix with a number. As founder of PriceKeel I set up the CRM, CPQ, forecast and pipeline reviews, and deal approvals from zero, then built the audit trail that lets Finance check every pricing decision instead of taking my word for it. That is the same muscle your BizOps seat needs between Sales, Marketing and CS: not a policy memo, a system someone can run without me in the room.

I have also sat on the other side of the CRM, where the data breaks. At Sensata I built the FY2026 Bleeders and Leakers pipeline in Power BI: 1,200 pricing opportunities against a $627M target across 3 regions and 20 product lines, with win rate, stage distribution and regional scorecards clean enough for leadership to act on without double-checking the source. That dashboard surfaced $433M in margin gaps, and running the negotiations it flagged recovered $700K plus in two quarters. Revenue data only helps if someone keeps it honest end to end, and that has been my job more than once.

On the AI-assisted half of your posting: I am not learning this on the job. As Strategic Marketing III at Applied Materials I already automate repetitive revenue and market analysis with AI agents built on Claude, which means I show up knowing how to build an automation, check its output, and not trust it blindly. Pair that with the quote and billing handoffs I ran with Sensata's finance team on multimillion-dollar customer deals, and the lead flow automation I rebuilt on WordPress and Pardot that cut cost per lead in half at Plug Power, and the shape of this role looks familiar: route it, automate it, then watch the metric to make sure the fix held.
