PITCH DECK | DOORDASH MANAGER, DASHER INTEGRATED MARKETING - EXPANSION & NEW BUSINESS BETS

The posting asks for hypothesis, pilot, then scale, decided on evidence before a national launch. I have run that exact motion on a product line that closed its first year at $2M+ in revenue.

30+ willingness-to-pay interviews before a single positioning decision, a solo zero-to-one build with no playbook, and the SQL/GA4 discipline that reads whether a pilot is actually working.

- **$2M+ first-year revenue** from a hypothesis-to-pilot-to-scale GTM at Sensata
- **30+ interviews** with OEMs and distributors before committing to a positioning
- **+15% conversion** from a positioning rebuilt on what those interviews said
- **SwipeHire:** a zero-to-one build, PRD to pricing to GTM, solo
- **AI agents built on Claude** automating my own recurring analysis today

WHY THIS DECK EXISTS

This req is not channel execution on an existing product. It is deciding whether a new earning opportunity has earned a national launch, before the budget gets spent.

What the posting actually asks for

Size the target Dasher audience and the TAM for a new earning opportunity, and decide which segment to prioritize first.

Form a hypothesis, run primary research (surveys, UXR interviews, concept tests, pilots), and translate what you learn into positioning and roadmap input.

Set success criteria before the pilot runs, then decide honestly whether to scale, iterate or stop.

What I have already built, the same way

At **Sensata**, I sized a new product's addressable market and owned the GTM end to end, hypothesis to pilot to scale, to $2M+ in first-year revenue.

I ran **30+ structured interviews** with OEMs and distributors before I wrote a single positioning line, and let the answers change the plan.

At **SwipeHire**, I ran 8+ A/B tests and 12+ user interviews solo, with no playbook, before scaling anything.

> The through-line: research runs before the launch decision, not after it, on every build on this page.

THE MANDATE, MAPPED

What the posting asks for, in its own words, and where the proof already sits.

What the role covers

> *"Define and size target Dasher audiences and cohorts for new earning opportunities, including TAM."*

> *"Own product-market fit work: form hypotheses, design and run research, and translate findings into positioning."*

> *"Run small-scale pilots to validate demand before investing in a national launch; decide whether to scale, iterate or stop."*

> *"Experience in 0-to-1 or early-stage launches where the product, audience and playbook were still being defined."*

My proof

Sensata GTM, new sensing products: sized the market, owned positioning, pricing and channel end to end, closing the first year at $2M+ revenue across North America and Europe.

30+ primary-research interviews: ran structured willingness-to-pay interviews with OEMs and distributors before building the positioning, not after shipping it.

KPI frameworks in SQL and GA4: built the read on 50K+ connected devices that separated real adoption from a launch plan's assumptions.

SwipeHire, zero-to-one: wrote the PRD, scoped the MVP, tested 3 pricing tiers and ran 8+ A/B tests with no existing playbook to follow.

THE PROOF, IN DEPTH

Research first, then let the numbers decide whether a bet scales.

Three different environments, same sequence: form the hypothesis, run the research, let the answer decide the next move before the spend goes up.

30+ Interviews

Before The Positioning Was Written

Structured willingness-to-pay research with OEMs and distributors at Sensata, run before the launch plan, not validated after it.

+15% Conversion

From Positioning Rebuilt On The Answers

The interviews changed what got said, not just how it was said, on priority launches.

$2M+ Revenue

First Year, Hypothesis To Pilot To Scale

The full arc this role runs on a new Dasher earning opportunity, owned end to end at Sensata.

None of these numbers existed before someone asked the audience first. That is the habit, not a one-time result.

FIRST 30 DAYS

What the first month sizing and testing a new Dasher earning opportunity looks like.

WEEK 1

Size the audience and form the hypothesis

Pull what Dashers are already saying about the newest earning opportunity (support tickets, forums, UXR and Audience Insights data), size the TAM, and write the hypothesis for the first segment worth testing.

Why first: the same market-first sequence behind Sensata's GTM, size before you message.

WEEK 2-3

Run the primary research and set success criteria

Design and run the surveys, interviews and concept tests that either confirm or kill the hypothesis, working with Product, Design and Strategy & Ops to set the pilot's success criteria before it launches, not after.

Why now: the same 30+-interview discipline that decided Sensata's positioning before it shipped.

WEEK 4

Launch the pilot and instrument the scale decision

Ship the small-scale pilot across in-app, owned and earned channels, wire the SQL/GA4 read that tells scale from iterate from stop, and bring the first AI-agent-automated version of that report, the same habit running at Applied Materials today.

Why this fast: a scale decision only holds up once the data behind it updates itself.

CLOSE

You are hiring someone to decide, on evidence, whether a new Dasher earning opportunity has earned a national launch. I have run that exact decision before, twice.

At **Sensata**, the hypothesis-to-pilot-to-scale arc on a new sensing product line: market sized, 30+ interviews run before a positioning line was written, and a first year that closed at **$2M+** in revenue on the back of a conversion lift of **+15%**.

At **SwipeHire**, the same arc solo and with no playbook: a zero-to-one build, pricing tested against real willingness-to-pay signals, and 12+ user interviews that shaped what shipped. I automate the repeatable part of that work today with AI agents built on Claude, so research time goes to the part of the problem nobody has structured yet.
