Hiring Team, Coinbase

Your posting asks for a product manager who can own a roadmap across Engineering, Data Science and Design and make real trade-offs between speed, coverage and user experience. At Sensata I owned the product roadmap for a connected sensor line and ran a 100+ feature backlog with Engineering in Agile across 3 regions, making exactly that call between shipping fast and shipping broad enough. The result was releases 25% faster and time-to-market cut 20%, on a platform running across 50K+ connected devices, not a spreadsheet exercise.

The instrumentation underneath that roadmap is the same discipline a risk product leans on: I built KPI frameworks in SQL and GA4 across that device fleet, defined the success metrics, and used the detection logic that flagged high-intent cohorts and adoption signals before they showed up in a quarterly review. I ran 30+ customer interviews with OEMs and distributors to turn weak signal into firm product requirements, and I have sat across the table from senior leadership translating technical trade-offs into a business case, the same translation your posting asks for when communicating risk trade-offs upward.

I also know what it takes to own a product from zero: I built SwipeHire's PRD, scoped its MVP and shipped it to 50+ early users, running 8+ A/B tests to find what actually moved activation rather than guessing. That same build-measure-learn loop, plus a working habit of pairing generative AI with a human review step rather than trusting it blind, is how I would approach owning one of your risk domains from day one.

Coinbase's risk team is protecting real customer losses at platform scale, which is the kind of problem worth building a career around. The fuller build trail, including the Sensata roadmap dashboards and the SwipeHire build, is at adhi-product.vercel.app/ref/coinbase.
