Hiring Team, Wayve

Translating complex AI and autonomous-driving technology into a narrative an OEM, a Tier 1 supplier, or a SoC architect will act on is a specific skill, and it is the one I built at Sensata selling a new sensing-product line into exactly that audience: OEMs and distributors who needed the engineering translated into a reason to switch. That launch drove $2M+ in first-year revenue and 35% more qualified leads, grounded in 30+ customer interviews before a single message got written.

The positioning itself is where I would start. I built the narrative that turned complex technical capabilities into differentiated customer value for distinct buyer segments, lifting conversion 15% on priority launches, and I ran competitive analysis across 10+ players to keep that positioning accurate as the market moved. Automated driving is a market where the technology changes fast enough that a stale competitive read shows immediately, and tracking that read directly, not secondhand, is how I have always worked.

Sales enablement is the other half of this role, and it is where I already have reps relying on my work. I built decks and case studies for 50+ reps and ran the competitive analyses behind their customer engagements, improving win rates 30%. I also build the market-sizing and value-based pricing models that back up a positioning claim at Applied Materials today, and automate recurring analysis with AI agents built on Claude, which is directly relevant to a product this technical.

I would welcome the chance to talk through how I would position Wayve's Embodied AI for an OEM audience that has heard a lot of AI pitches already. More of this work is at adhi-product-ai.vercel.app/ref/wayve.
