Hiring Team, Vercel

At Sensata I built KPI frameworks in SQL and GA4 across 50,000+ connected industrial devices, segmenting the accounts that were drifting toward churn from the ones ready to expand, and ran 30+ customer interviews to map where the journey actually broke down for OEMs and distributors. That is close to the problem your posting describes: developers and enterprise buyers moving through the same product on two different clocks, and a lifecycle program has to catch both without confusing either one.

The automation side is not new either. At Plug Power I rebuilt the WordPress-to-Pardot lead flow end to end, cutting cost per lead 50%, then automated the surrounding Mar-Tech stack (Salesforce, Adobe Analytics, GA, Google Tag Manager) so reporting ran on its own instead of a weekly manual pull. At Pixis I carried P&L for an 8-client, \$15K-\$90K-per-client-per-month portfolio, cut client churn 50% through proactive account strategy and vertical playbooks, and used Amplitude and Tableau to lift blended campaign ROAS 40%, the same segmentation-into-retention loop your team is running at a much larger scale.

At Applied Materials I now automate the repetitive side of my own forecasting and market-sizing work with AI agents built on Claude, not because a manager assigned it but because rebuilding the same pivot table every cycle wastes a decision-maker's time. Vercel's bet that the next layer of software gets built and operated by agents, not just used by people, is the same shift I have been building my own workflow around. A lifecycle team that has to design triggers, tests and journeys for agents as well as humans is a harder, more interesting version of the job I already do.

I would like to bring the segmentation-and-journey work from Sensata together with the automation habit from Applied Materials to Vercel's lifecycle motion, for both the self-serve developer and the enterprise buyer. Proof trail at adhi-growth-ai.vercel.app/ref/vercel.
