Hiring Team, Meta

The posting describes a go-to-market owner for "agents, models, and solutions for developers and Enterprises," and that breadth is the part I'd point to first. At Sensata I ran a version of it at smaller scale: GTM for a new line of sensing products sold through direct OEM relationships and distributor channels at the same time, which meant positioning, pricing and launch each had to hold up for two buyer types with different technical bars. I ran 30+ structured interviews with the engineers who had the final say, used that feedback to rework the launch plan before it shipped, and enabled 50+ reps once the message was set. First-year revenue came in above $2M, with win rates up 30%.

Your preferred qualifications track closely with what I do now. At Applied Materials, I use AI agents built on Claude to run market-sizing and competitive analysis that used to eat a week of manual work, and prompt and context engineering is a skill I keep building rather than a bullet point. The responsible-AI piece is part of the same job, not a separate step: before an agent-produced view lands in front of leadership, I run a quality and accuracy check on it, since a wrong market read sends a real product decision off course.

Representing the market internally to Product, Engineering and Research is the other half of what I do day to day. At Applied Materials, field and technical input from Sales, Engineering and Accounts gets turned into one view that informs pricing and forecasting decisions. At Sensata, tracking competitor and customer behavior across the US and EMEA gave product calls a factual floor instead of a guess. A developer and Enterprise AI portfolio moving at Meta's pace needs that view refreshed constantly, and leading cross-functional teams through influence rather than ownership is a muscle I use every week, not an occasional skill.

What I bring is someone who has already closed this loop: market assessment that holds up, positioning tested against a technical buyer before launch, enablement that the field actually uses, and AI built into the workflow itself rather than referenced after the fact. Full proof trail at adhi-product-ai.vercel.app/ref/meta.
