Hiring Team, DoorDash

Your posting for DoorDash for Business asks for someone who builds test plans that measurably move merchant and quality metrics, not someone who reports on them after the fact. At Sensata I built the SQL and GA4 KPI framework behind a new sensing product's launch across 50K+ connected devices, used it to find the usage cohorts that actually predicted adoption, and watched that framework lift feature adoption 18% and CSAT 22% once the fixes it pointed to shipped.

The shape of this seat, support one week, analytics the next, close partnership with product the week after, is one I already run. At Sensata I owned a 100+ feature backlog with engineering in Agile across 3 regions, testing fixes before they shipped broadly and cutting time-to-market 20%. At Applied Materials I partner with Sales, Engineering and Accounts to size a market none of those functions could map alone, the same multi-team pull this role needs across sales, partner management, operations, product, engineering and business development.

On the economics side: I built the FY2026 Bleeders and Leakers program at Sensata from a blank page, a test against 1,200 pricing opportunities tracked against a $627M target, and used it to surface $433M in margin gaps for leadership to act on. That is the same instinct I would bring to evaluating merchant and dasher quality economics here: build the model myself in SQL and Excel, run the test, and let the pattern in the data make the call instead of a hunch.

I would welcome 30 minutes to talk about which quality pilot DoorDash for Business is closest to scaling next. More on how I build these models is at adhithyabhaskar.vercel.app/ref/doordash.
