Hiring Team, Glean

Thirty-plus interviews with OEM and distributor customers at Sensata is where I learned the habit this req is asking for: find where the workflow actually breaks, not where the backlog assumes it does. Those conversations reshaped a product roadmap and raised CSAT 22% and feature adoption 18% across 50,000+ connected devices. That is the research-first instinct I would bring to defining what Enterprise Intelligence actually does for a team on day one.

On the data side, I built the FY2026 Bleeders and Leakers Power BI dashboard at Sensata: 1,200 pricing opportunities tracked against a \$627M target, with regional scorecards and win-rate views that surfaced \$433M in margin gaps for leadership to prioritize by product line. A dashboard only earns a daily open if it is built backward from the decision someone needs to make, not forward from whatever data happens to exist, and that is the standard I would hold an enterprise context layer to.

The cross-functional scoping is familiar ground too. I managed a 100+ feature backlog with Engineering in Agile across three regions, and at Applied Materials I build my own Claude AI agents to automate the repetitive parts of forecasting, so I already think in terms of what a model should own versus what a person needs to review before it ships.

Enterprise Intelligence reads like a category you are still naming rather than implementing from a template, and that is the kind of ambiguity I would rather work in than avoid. Proof trail at adhi-product-ai.vercel.app/ref/glean.
