Hiring Team, Nourish

Your posting frames retention as a sizing problem: find where patients are falling out of care, size the opportunity, then build the fix. I have run that exact sequence before, just not on patients. At Pixis, churn across an 8-client ad-tech portfolio was climbing for reasons nobody had mapped yet. I built the account-strategy and channel-diversification playbooks that found where clients were falling out of the relationship, cutting churn 50%. The sizing-to-fix sequence is the same; only the subject changes.

The data half of the role is just as familiar. At Sensata I built the SQL and GA4 KPI framework behind 50,000+ connected industrial devices, the quantitative layer that found which cohorts were adopting and which were stalling, then ran 30+ structured interviews to understand why, the qualitative layer your posting asks for in the same breath. That combination lifted feature adoption 18% and CSAT 22%, and it is the same instinct retention work runs on: do not guess where people drop off, go measure it.

0-to-1 is not new either. I built SwipeHire from a blank PRD to a validated activation funnel, instrumenting the GA4 tracking myself, running 8+ A/B tests and 12+ user interviews, and lifting activation 25% before I had anyone to delegate to. Owning a problem nobody has built a playbook for yet, then building the measurement and the fix in the same motion, is exactly what an early member of a new growth function needs to do.

I am Strategic Marketing III at Applied Materials today, where I run Claude AI agents to automate the recurring analysis that used to eat my week, the same habit that frees up time for this kind of 0-to-1 work. I would like to bring the churn-reduction and KPI-sizing playbook to Nourish's retention problem.
