Hiring Team, SandboxAQ

Your posting describes a growth engine built from the ground up: campaigns, workflows, reporting and process, all measured through sourced and influenced pipeline. I built exactly that at Plug Power, running $100K/month across Google Ads, Microsoft Ads, Meta and LinkedIn with my own bid optimization and A/B testing, cutting CPA 25% and cost per lead 50% by automating the Pardot-to-Salesforce lead-nurture flow myself rather than waiting on a bigger team.

Marketing to a hard-to-reach technical buyer is the harder half of this role, and it is where I have spent most of my career. At Sensata I built the KPI and attribution frameworks in SQL and GA4 that turned 50K+ connected industrial devices into a usable funnel, then translated sensor specifications into positioning that engineers and OEM buyers actually read, lifting conversion 15% on priority launches. Computational chemists and materials researchers are a different technical audience than connected-device engineers, but the translation work is the same: find the signal inside a complex, instrumented system and make it legible to Sales and to the buyer.

I also think the fastest way to build a growth engine from zero is to automate the reporting before you need it, not after. At Applied Materials I run AI agents built on Claude against repetitive market analysis so a forecasting model gets rebuilt in minutes instead of days. At Pixis, an AI ad-optimization platform, I used Amplitude and Tableau to keep funnel and attribution data honest across 30+ campaigns and 8 client accounts running at once, each with its own cost-per-pipeline target. I partner with Sales, Product Marketing and RevOps by habit, and I would like to bring that same full-funnel discipline to the AI Simulation team's pipeline.
