Hiring Team, Notion

Your posting asks for someone who turns an ambiguous customer problem into a roadmap engineering can actually build against, not someone who inherits a backlog already in motion. At Sensata, I defined the product roadmap for a sensor line and owned a 100+ feature backlog with engineering in Agile across 3 regions, cutting time-to-market 20% and lifting release velocity 25%. That is the same find-the-problem, set-the-strategy, build-it-with-engineering motion your posting describes, not a biography of past titles.

Customer depth was not a side activity there either. I ran 30+ structured interviews with OEMs and distributors to find what was actually breaking for them, then let those conversations, not a stakeholder request list, set the roadmap, raising CSAT 22%. I also built the KPI frameworks in SQL and GA4 across 50,000+ connected devices that showed which cohorts were adopting and which were not, the same muscle your posting calls customer depth: translating differing needs into one coherent strategy instead of a pile of one-off asks.

I have also run the zero-to-one half of this job, not just the at-scale half. I built SwipeHire, an AI job-matching platform, from a blank page: wrote the PRD, scoped the MVP, shipped it in Python, the OpenAI API and React, and grew it to 50+ early users on 12+ interviews and 8+ A/B tests I ran myself. Nobody handed me that roadmap either, and the tradeoffs between user experience, speed and quality were mine to make.

Practical AI fluency is not new territory for me. SwipeHire was built on the OpenAI API from day one, and at Applied Materials today I automate my own recurring forecasting and pricing analysis with agents built on Claude so the time goes into the next decision, not the last report.
