Hiring Team, Perplexity

Your posting describes the role as half builder, half connective tissue, and that split is close to how I already operate. At Sensata, I built the FY2026 Bleeders and Leakers Power BI dashboard that tracked 1,200 pricing opportunities against a \$627M target across 3 regions and 20 product lines, then traced \$433M in surfaced gaps down to \$700K+ actually recovered in two quarters. That dashboard did not exist before I built it. Leadership ran their weekly reviews off it afterward, which is the same thing you are describing when you say the team needs tools that stay reliable as more people depend on them.

Right now I run that same builder-and-operator loop for my own company. As founder of PriceKeel, I evaluated, configured and run the CRM and CPQ myself, and I designed the audit trail that gives Finance a documented record behind every pricing decision, so agreements and exceptions never sit waiting on someone to remember why a call was made. I sell against legacy CPQ and deal-desk tooling to RevOps, Sales leadership and Finance teams, which means I spend a lot of time thinking about how a team picks, provisions and eventually retires a tool, not just how it uses one.

At Applied Materials I automate the recurring parts of my own analysis work with AI agents built on Claude, because the manual version of that work is the first thing I look to cut whenever a process gets repetitive. At Plug Power I automated the Mar-Tech stack end to end across Salesforce, Adobe Analytics, GA and Tag Manager for closed-loop reporting, while owning the budgets and team that stack served. That is the same scope your posting lays out: own the systems underneath a busy team, keep the handoffs from dropping anything, and add rigor without adding meetings.

I like roles where nobody has drawn the job description yet, because that is usually where the actual leverage sits. Proof trail at adhithyabhaskar.vercel.app/ref/perplexity.
