Hiring Team, Google

The pricing model I built at Sensata flagged line items where a configurable price change could lift profitability more than 50%, and it drove a 12% YoY revenue gain inside two quarters. That is the same lever a Cloud Billing team pulls when it builds configurable pricing and flexible invoicing for customers who do not fit one flat rate card.

I have also owned the other half of that work: the roadmap and the PRDs that turn a commercial idea into something engineering can ship. At Sensata I ran a 100+ feature backlog with engineering in Agile across three regions, wrote the PRDs that carried it, and ran 30+ customer interviews with OEMs and distributors that raised CSAT 22%. A Cloud Billing roadmap asks for the same muscle your posting describes: connect the technical and business sides of a product, then land the solution across the full lead-to-cash process.

Right now at Applied Materials I build the forecasting and market-sizing models that sit between Engineering, Sales and the business, validating market size and opportunity before a product group commits to it. I automate the repetitive parts of that analysis with AI agents built on Claude, so the judgment calls get the hours instead of the spreadsheet.

I would like to bring that combination, pricing models that move revenue and roadmaps that ship on schedule, to the team building the commercial backbone under Google Cloud.
