PITCH DECK | LYFT STAFF PRODUCT MANAGER I, BASE PRICING

Base Pricing's hardest problem isn't the model. It's getting a market manager to trust the price change it recommends enough to ship it across hundreds of markets. I have already closed that exact trust gap, just with a different model underneath.

Deal-by-deal margin discipline at industrial scale, and a decision-integrity product built from zero, on the same resume.

- **$700K+ margin recovered** in 2 quarters, deal-by-deal against margin thresholds at Sensata
- **53% to 61% distributor margins** lifted by repricing through distribution
- **1,200 opportunities / $627M target** tracked across 3 regions, 4 families, 20 product lines
- **Explainable guardrail + audit trail** built from scratch at PriceKeel
- **AI agents built on Claude** automating my own recurring pricing analysis today

WHY THIS DECK EXISTS

The mandate is not "tune a pricing model." It is getting that model's output trusted enough to ship, across a portfolio of ride types, with no playbook to copy.

What that actually requires

Translating the cost to fulfill a ride into a price at whatever granularity the market needs, by time, location or trip type, then defending that call upward.

Jointly optimizing standard, alternative-mode and scheduled rides as one portfolio instead of three separate levers pulled in different directions.

Making impact-estimation output accurate and trusted by market management teams, not just correct on a slide.

What I have already run

At **Sensata**, I evaluated deal-by-deal pricing against margin thresholds across 1,200 opportunities and a $627M target, the same unit-to-portfolio translation this role runs across ride types.

At **Sensata** again, I drew the granularity line across 3 regions, 4 product families and 20 product lines in the FY2026 dashboard, the by-time, by-location, by-type call Base Pricing makes every week.

At **PriceKeel**, I built the trust layer itself: an explainable guardrail plus an audit trail, so a recommendation survives the question of why.

The through-line: every pricing system I have touched started with a model nobody trusted yet, and ended with a number leadership could act on.

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Determining the optimal granularity at which Lyft sets base prices (e.g., by time, location, and type of trip)."*

> *"Jointly optimizing prices across ride types, so that standard, alternative modes, and scheduled rides are priced as one portfolio."*

> *"Making our impact estimation models accurate and trusted by market management teams."*

My proof

Sensata, granularity: drew the pricing line across 3 regions, 4 product families and 20 product lines in a live FY2026 dashboard, not a one-size model.

Sensata, portfolio view: the Bleeders and Leakers program evaluated 1,200 opportunities against a single $627M target as one book, not 1,200 isolated calls.

PriceKeel, trust: an explainable discount guardrail and audit trail built so a non-technical reviewer trusts the recommendation on sight.

Applied Materials, scale: forecast inflection points and build value-based pricing for a fast-growing market, the cost-to-price translation this role runs for every ride type.

THE PROOF, IN DEPTH

Draw the granularity line, treat the portfolio as one book, then put a number on it.

Same pattern across two companies and a founded company: decide how finely to slice the pricing decision, ship the recommendation as one portfolio view, then measure whether leadership actually acted on it.

$700K+ Margin

Recovered in 2 Quarters

Bleeders and Leakers program, deal-by-deal against margin thresholds and competitive gaps at Sensata.

53% to 61%

Distributor Margins Lifted

Repriced parts sold through distribution and held partners to the new rate discipline, in under 2 quarters.

1,200 / $627M

Opportunities Tracked as One Portfolio

Across 3 regions, 4 product families and 20 product lines, surfacing $433M in margin gaps for leadership.

None of these was a dashboard that sat in a folder. Each one closed the loop from a model's output to a decision the business actually shipped.

FIRST 30 DAYS

What the first month on Base Pricing's roadmap and vision looks like.

WEEK 1

Map the granularity decision end to end

Pull the existing base-price data by time, location and trip type alongside Engineering, Data Science and Market Management, so the first granularity call is grounded in what the data already shows, not a guess.

Why first: the same first move behind drawing the pricing line across 3 regions and 20 product lines at Sensata.

WEEK 2-3

Ship the first portfolio-level price view

Work directly with the downstream dynamic-pricing team to frame standard, alternative-mode and scheduled rides as one priced portfolio, versioned once instead of three levers pulled separately.

Why now: the same one-book framing that treated 1,200 pricing opportunities as a single $627M target at Sensata.

WEEK 4

Stand up the trust layer market managers need

Build the first impact-estimation explainer market managers can act on without re-deriving the model, then automate the recurring reporting step with an AI agent so the explainer updates every cycle.

Why this fast: the same explainable-guardrail design behind PriceKeel's audit trail, and the same AI-agent habit running my reporting at Applied Materials today.

CLOSE

Lyft is hiring someone to make a pricing model's output trusted enough to ship across hundreds of markets. I have already closed that exact trust gap, with a number on each attempt.

The margin half: **$700K+ recovered in 2 quarters** and distributor margins lifted **53% to 61%**, evaluating deal-by-deal pricing against margin thresholds at Sensata, tracked as one $627M portfolio across 3 regions and 20 product lines.

The trust half: **an explainable guardrail and audit trail** built from scratch at PriceKeel, the company I founded, so a pricing recommendation survives the question of why. At Applied Materials I now automate my own recurring pricing analysis with agents built on Claude, because rebuilding the same report every cycle is time that should go into the next price decision.
